Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Ţ

prevents receptor bir permeability, useful

Claim 2; Page 42-43; 90pp; English

Anti-advanced glycosylation end product polypeptide antibody prevents receptor binding and therefore reduces vascular permeability, useful to treat diabetes mellitus

```
This is the amino acid sequence of a fragment of the human soluble Receptor for Advanced Glycation Endproducts (RAGE). RAGE interacts with a range of physiologically and pathophysiologically relevant ligands when considering tumour invasion. In normal developing neurons RAGE colocalizes with amphoterin which is a matrix associated polypeptide. The expression of both RAGE and amphoterin decreases after birth, but both have increased expression in tumours. RAGE polypeptides AAY52132-Y52135 are used in the invention in a method for inhibiting tumour invasion and metastasis. The method involves inhibiting tumour invasion and metastasis via administration of a therapeutically effective invasion and metastasis via administration of a therapeutically effective
                                                                            amount of the pharmaceutical composition containing a RAGE polyper The invention also relates to a method for evaluating the ability agent to inhibit tumour invasion in a local cellular environment. can be administered to a patient in a pharmaceutically acceptable
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 29; Page 62;

                        This is a human advanced glycosylation end-product receptor (RAGE) polypeptide (318 amino acid residues). The RAGE polypeptides and its active fragments or their mimetics, inhibit interaction between advanced glycosylation end-products (AGE) and a receptor (specifically RAGE). They are used to treat diseases associated with AGE/RAGE interaction, such as increased vascular permeability, diabetes mellitus (particularly complications such as micro- or macro- vasculopathy or occlusive vascular disorders such as neuropathy, nephropathy, retinopathy or atherosclerosis) or haemodialysis-associated amyloidosis, also activation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           RAGE. Advanced glycosylation end products (AGE) of proteins are non-enzymatically glycosylated proteins, which accumulate in vascular tissue in ageing, and at an accelerated rate in individuals with diabetes. The Ab, which prevents the interaction between an AGE and it's receptor (RAGE), reduces vascular permeability. The Ab can be used to treat diabetes mellitus symptoms, e.g. maiorives culopathy, occlusive vascular disorders, neuropathy, nephropathy, retinopathy, haemodialysis associated amyloidosis or atherosclerosis. The Ab can also be used for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence represents a mature human receptor to an advanced glycosylation end product (RAGE) polypeptide. The present invention describes an isolated antibody (Ab), specifically immunoreactive with
                                                                                                                                                                                                                                                                                                                                                                            New soluble advanced glycosylation end-product receptor polypeptide - used for reducing vascular permeability, complications of diabetes etc., also for purification and to screen for modulators

                                                                         considering tumour invasion. In normal developing neurons RAGE colocalizes with amphoterin which is a matrix associated polypeptide. The expression of both RAGE and amphoterin decreases after birth, but both have increased expression in tumours. RAGE polypeptides AAY52132-Y52135 are used in the invention in a method for inhibiting tumour invasion and metastasis. The method involves inhibiting tumour invasion and metastasis via administration of a therapeutically effective amount of the pharmaceutical composition containing a RAGE polypeptide. The invention also relates to a method for evaluating the ability of an agent to inhibit tumour invasion in a local cellular environment. RAGE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            age-related disorders such as oxidative stress. These RAGE polypeptides are also used, when immobilised, to purify AGE from a protein mixture at to screen for compounds that are agonists and antagonists of AGE/RAGE interaction. They can also be used diagnostically to detect abnormal levels of AGE. Antibodies against RAGE polypeptides are useful as immunoassay reagents for measurement of RAGE levels, and as inhibitors of the compounds of the compound of the c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Soluble receptor for advanced glycation endproducts; RAGE; tumour; invasion; metastasis; amphoterin; neuron; inhibit; therapy.

                                                                                                                                                             The present sequence represents a soluble human receptor to an advanced glycosylation end product (RAGE) polypeptide. The present invention describes an isolated antibody (Ab), specifically immunoreactive with RAGE. Advanced glycosylation end products (AGE) of proteins are non-enzymatically glycosylated proteins, which accumulate in vascular tissue in ageing, and at an accelerated rate in individuals with diabetes. The Ab, which prevents the interaction between an AGE and it's receptor (RAGE), reduces vascular permeability. The Ab can be used to treat diabetes mellitus symptoms, e.g. microvasculopathy, occlusive
                                                                                                                                                                                                                                                                                       Claim 2; Page 40-41; 90pp; English.

                                                age-related disorders such as oxidative stress. These RAGE polypeptides are also used, when immobilised, to purify AGE from a protein mixture and to screen for compounds that are agonists and antagonists of AGE/RAGE interaction. They can also be used diagnostically to detect abnormal levels of AGE. Antibodies against RAGE polypeptides are useful as immunoassay reagents for measurement of RAGE levels, and as inhibitors of interaction between AGE and RAGE or other receptors and for purification and quantification of RAGE polypeptides. The encoding nucleic acids are used to express recombinant RAGE and as probes for isolating related
                                                                                                                                                                                                           disorders such as neuropathy, nephropathy, retinopathy or atherosclerosis) or haemodialysis associated amyloidosis, also activation of microglial cells by beta-amyloid peptides in Alzheimer's disease or
                                                                                                                                                                                                                                                             This is a human advanced glycosylation end-product receptor (RAGE) polypeptide (340 amino acid residues). The RAGE polypeptides and its active fragments or their mimetics, inhibit interaction between advanced glycosylation end-products (AGE) and a receptor (specifically RAGE). They are used to treat diseases associated with AGE/RAGE interaction, such as increased vascular permeability, diabetes mellitus (particularly complications such as micro- or macro- vasculopathy or occlusive vascular diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                              New soluble advanced glycosylation end-product receptor polypeptide - used for reducing vascular permeability, complications of diabetes etc., also for purification and to screen for modulators

                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes a material for extracorporeal circulation which is made from a water-insoluble carrier immobilized with a protein having the sequence shown here. The materials of the invention, including adsorbents, are for extracorporeal circulation, which are applicable in the selective elimination of diabetic complication factors from a body
                                                                      Human; soluble receptor; advanced glycosylation end AGE; antibody; vascular permeability; immunologicall diabetes mellitus.
                                                                                                                                                                                                                                                                                                                                                                                          fluid, and are therefore useful in treating vascular lesions arteriosclerosis due to carbonyl stress products caused by alpromoted carbonyl stress from excretory dysfunction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Material for extracorporeal circulation, applicable in selective elimination of diabetic complication factors such as carbonyl stress products caused by abnormally promoted carbonyl stress from excretory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Extracorporeal circulation; carbonyl stress product; diabetes; vascular lesion; excretory dysfunction.
                                                                                                                                                                      AAW44214;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 dysfunction in vascular lesions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    08-SEP-1999;

The present invention describes an isolated antibody (Ab), specifically immunoreactive with RAGE. Advanced glycosylation end products (RGE) of proteins are non-enzymatically glycosylated proteins, which accumulate in vascular tissue in ageing, and at an accelerated rate in individuals with diabetes. The Ab, which prevents the interaction between an AGE and it's receptor (RAGE), reduces vascular permeability. The Ab can be used to treat diabetes mellitus symptoms, e.g. microvasculopathy, haemodialysis associated amyloidosis or atherosclerosis. The Ab can also be used for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Anti-advanced glycosylation end product polypeptide antibody prevents receptor binding and therefore reduces vascular permeability, useful to treat diabetes mellitus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Advanced glycosylation end-product receptor; RAGE; screening; AGE; vascular permeability; diabetes mellitus; treatment; atherosclerosis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    age-related disorders such as oxidative stress. These RAGE polypeptides are also used, when immobilised, to purify AGE from a protein mixture and to screen for compounds that are agonists and antagonists of AGE/RAGE interaction. They can also be used diagnostically to detect abnormal levels of AGE. Antibodies against RAGE polypeptides are useful as immunoassay reagents for measurement of RAGE levels, and as inhibitors of interaction between AGE and RAGE or other receptors and for purification and quantification of RAGE polypeptides. The encoding nucleic acids are used to express recombinant RAGE and as probes for isolating related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This is a peptide fragment of a human advanced glycosylation end-product receptor (RAGE) polypeptide. The RAGE polypeptides and its active fragments or their minmetics can inhibit interaction between advanced glycosylation end-products (AGE) and a receptor (specifically RAGE). They are used to treat diseases associated with AGE/RAGE interaction, such as increased vascular permeability, diabetes mellitus (particularly complications such as micro- or macro- vasculopathy or occlusive vascular disorders such as neuropathy, nephropathy, atherosclerosis or retinopathy) or haemodialysis-associated amyloidosis, also activation of microgilal cells by beta-amyloid peptides in Alzheimer's disease or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            etc.,
             Anti-advanced glycosylation end product polypeptide antibody prevents receptor binding and therefore reduces vascular permeability, useful to treat diabetes mellitus
                                                                                                                                                                                                           11-APR-1997;
                                                                                                                                                                                                                                                                                                                                      diabetes mellitus
                                                                                                                                                                                                                                                                                                                                                Human; soluble receptor; advanced glycosylation end product; AGE; antibody; vascular permeability; immunologically active
                                                                                                                                                                                                                                                                                                                                                                                                                                   14-MAY-1998
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Disclosure; Page 9;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New soluble advanced glycosylation end-product receptor polypeptide - used for reducing vascular permeability, complications of diabetes
                                                                                                                                                                                                                                          23-OCT-1997
                                                                                                                                                                                                                                                                      W09739125-A1

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  RAGE. Advanced glycosylation end products (AGE) of proteins are non-enzymatically glycosylated proteins, which accumulate in vascular tissue in ageing, and at an accelerated rate in individuals with diabetes. The Ab, which prevents the interaction between an AGE and it's receptor (RAGE), reduces vascular permeability. The Ab can be used to treat diabetes mellitus symptoms, e.g. microvasculopathy, occlusive vascular disorders, neuropathy, nephropathy, retinopathy, haemodialysis associated amyloidosis or atherosclerosis. The Ab can also be used for the isolation and purification of human RAGE polypeptide.
        This is a peptide fragment of a human advanced glycosylation end-product receptor (RAGE) polypeptide. The RAGE polypeptides and its active fragments or their mimetics can inhibit interaction between advanced glycosylation end-products (AGE) and a receptor (specifically RAGE). They are used to treat diseases associated with AGE/RAGE interaction, such as increased vascular permeability, diabetes mellitus (particularly complications such as micro- or macro- vasculopathy or occlusive vascular disorders such as neuropathy, nephropathy, atherosclerosis or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence represents an immunologically active for a soluble human receptor to an advanced glycosylation ensproduct (RAGE) polypeptide. The present invention describes an isolated antibody (Ab), specifically immunoreactive with
                                                                                                                                                                               New soluble advanced glycosylation end-product receptor polypeptide - used for reducing vascular permeability, complications of diabete etc., also for purification and to screen for modulators
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAW33762 standard; peptide; 15
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Alzheimer's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human RAGE polypeptide fragment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         08-MAY-1998
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Claim

These RAGE polypeptides are also used, when immobilised, to purify AGE from a protein mixture and to screen for compounds that are agonists and antagonists of AGE/RAGE interaction. They can also be used diagnostically to detect abnormal levels of AGE. Antibodies against RAGE polypeptides are useful as immunoassay reagents for measurement of RAGE levels, and as inhibitors of interaction between AGE and RAGE or other receptors and for purification and quantification of RAGE polypeptides. The encoding nucleic acids are used to express recombinant RAGE and as probes for isolating related
Also described are methods for: (1) inhibiting an amyloid-beta peptide (ABP) interaction with a receptor for RAGE when the receptor is on the surface of a cell; (2) inhibiting degeneration of a neuronal cell; (3) inhibiting formation of an ABP fibril on a cell; (4) inhibiting extracellular assembly of an ABP into a fibril; (5) inhibiting aggregation of ABP on the surface of a cell; (6) inhibiting infiltration of a microglial cell into senile plaques; (7) inhibiting activation of a
                                                                                                                                                                                                                        The present invention describes novel isolated peptides (I) having a amino acid sequence corresponding to an amino acid sequence of a V-domain of a receptor for an advanced glycation end product (RAGE).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          multiple sclerosis; amyloidosis; autoimmune disease; tumour; cancer; male impotence; wound healing; period
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   senility; renal failure; hyperlipidaemic atherosclerosis; dementia neuronal cytotoxicity; head trauma; amyotrophic lateral sclerosis;

The present invention describes novel isolated peptides (I) have amino acid sequence corresponding to an amino acid sequence of V-domain of a receptor for an advanced glycation end product (Notes) and the sequence of the s

peptides based on

es based on an advanced treating Alzheimer's di

disease

and

end pro

product receptor

syndrome

having an

(RAGE)

glycation

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Вþ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      CC (ABP) interaction with a receptor for RAGE when the receptor is on the CC surface of a cell; (2) inhibiting degeneration of a neuronal cell; (3) clinhibiting formation of an ABP fibril on a cell; (4) inhibiting CC extracellular assembly of an ABP into a fibril; (5) inhibiting infiltration of a microglial cell into senile plaques; (7) inhibiting activation of a CC aggregation of ABP on the surface of a cell; (6) inhibiting activation of a cC cell; (9) evaluating the ability of an agent to inhibit binding of an CC associated with an interaction of an ABP with a receptor for RAGE on a CC cell; (9) evaluating the ability of an agent to inhibit binding of an CC ABP with a v-domain of a receptor for RAGE on the surface of a cell; (10) inhibiting activation of a RAGE when the receptor is on the surface of a cell; (2) and (13) treating a subject with a condition associated with an CC with a receptor for RAGE on a scoll. The methods CC and coll treating conditions associated with an interaction of an BAGE with a receptor for RAGE on a cell. The methods CC can be used for treating conditions associated with an interaction of an CC can be used for treating conditions associated with an interaction of an BAGE with a receptor for RAGE, e.g. diabetes, Alzheimer's CC disease, senility, renal failure, hyperlipidaemic atherosclerosis, amyloidosis, an analytimume disease. Inflammation, a tumour cancer male impressed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

The present invention describes an isolated antibody (Ab), specifically immunoreactive with RAGE. Advanced glycosylation end products (AGE) of proteins are non-enzymatically glycosylated proteins, which accumulate in vascular tissue in ageing, and at an accelerated rate in individuals with diabetes. The Ab, which prevents the interaction between an AGE and it's receptor (RAGE), reduces vascular permeability. The Ab can be used to treat diabetes mellitus symptoms, e.g. microvasculopathy, occlusive vascular disorders, neuropathy, nephropathy, retinopathy, haemodialysis associated amyloidosis or atherosclerosis. The Ab can also be used for the isolation and purification of human RAGE polypeptide.
